Relation of the size of the prostate gland to endometrial histology in surgical samples of endometrial cancer. This study examines the correlation between prostate gland size and histology in surgical samples of endometrial cancer. Using transrectal ultrasound, the size of the prostate gland was retrospectively measured in 179 women (the women's median age was 60 years) who had endometrial cancer and underwent staging surgery at our institution between January 2000 and December 2004. The median size of the prostate gland was 38.5 g for women with a biopsy-proven

diagnosis of endometrial cancer, 56.3 g for those who were diagnosed with endometrial cancer on the basis of an elevated serum CA-125 level alone, and 51.3 g for those who had no preoperative biopsy. The median size of the prostate gland was 57.6 g in endometrial cancer without any other histological abnormalities, and 53.9 g in endometrial cancer associated with other pathology. The size of the prostate gland was not significantly correlated with any pathological finding. Although the size of the prostate gland was significantly correlated with age, menstrual status, preoperative CA-125 level and operation method, there was no relation to the pathological findings.

The size of the prostate gland is not a marker of endometrial cancer, and thus cannot be used for selection of patients for preoperative biopsy of the endometrium.You can now link your Steam account to your Nintendo Network ID to make it easier to keep track of your games across platforms. Users will be able to view their games and progress across consoles in the Steam > Manage Inventory section, and their achievements will also be available. The link will also help match up games purchased on one platform with their respective DLC in other platforms. You can follow @SteamPowered on Twitter for all the latest Steam news. N.B. Steam.PETDOG CATERED TO It is our pleasure to serve your pet's nutrition needs and help keep them healthy. Our pet food is grain free and contains no artificial colors, flavors or preservatives. Our products are grain free to help extend the life of your pet's favorite food and offer them the highest nutritional value. We use the very highest quality ingredients and all our products are 100% or better cruelty free, gluten free, GMO free, trans fat free, no added hormones or fillers

What's New In?

Nursing homes across the state are being monitored after staff at the

least one facility are being tested for coronavirus and other infections. On Tuesday morning, Connecticut's Health Department confirmed the state's first coronavirus case on an employee of a nursing home in Ansonia. On March 11, the department announced a second confirmed COVID-19 case, a resident of the same facility in Ansonia. Departments spokesman Eric Wren said Tuesday the agency began testing staff at the two facilities where coronavirus cases have been confirmed "immediately." More employees will be tested at each of the state's nine nursing homes. "Staff members or individuals suspected of having an illness that

could be COVID-19 will be sent to a hospital for testing," the department said. Gov. Ned Lamont and state Health Commissioner Dr. George Kollidas said in a statement, "We are taking this very seriously as the virus spreads." "Nursing homes are a very vulnerable population. This is a crisis that deserves the utmost attention. In addition, these are the first patient-to-staff and patient-to-patient transmissions of COVID-19 in Connecticut," the governor said. Wren said there were 84 COVID-19 tests of staff and residents of the two facilities where COVID-19 cases have been confirmed. He said more tests are being requested "as necessary." Connecticut is the first

state to develop a coronavirus protocol for nursing homes. "The Health Department is working with the Office of Senior and Disability Services and our other partners to develop and recommend best practices for nursing homes, including preparation for COVID-19 in these facilities," Wren said. While most of the 84 people tested who worked at the two facilities with cases are showing no signs of the illness, they are being monitored, Wren said. The department said the residents in the two nursing homes are "well enough to be cared for at home," and they are in "good health and are being monitored." Other facilities have been identified as

possible COVID-19 cases. Wren said the Department of Social Services identified the case in a training room in a children's agency, and that staff there were in self-quarantine. The department also recently identified that a hotel is a possible COVID-19 case after three employees there showed mild flu-like symptoms. Two of
